

ABSTRACT

The invention concerns methods for network-supported realization of a project based on a project proposal, for the realization of which a sequence of successive work steps to be implemented is provided. On a first computer, a first electronic page is provided that can be loaded onto a second computer via an information transmission network. The first electronic page comprises a field with which the project proposal is documented. After the documentation, an electronic file is created, and subsequently the persons provided for the processing of the project proposal are automatically informed about the project proposal with electronic messages.
